• Plasma is made of too many particles to keep track of.

 $\bullet~\geq 10^{14}$ particles per cm^3 in fusion

- Plasma is made of too many particles to keep track of.
 - $\bullet~\geq 10^{14}$ particles per cm^3 in fusion
- The **particle distribution function** f(x, v, t) represents the number of particles with velocity v, at position x, at time t.

- Plasma is made of too many particles to keep track of.
 - $\bullet~\geq 10^{14}$ particles per cm^3 in fusion
- The **particle distribution function** f(x, v, t) represents the number of particles with velocity v, at position x, at time t.
- Taken to be normalized:

$$\int_{-\infty}^{\infty}\int_{-\infty}^{\infty}f(x,v,t)dxdv=1$$

For $(x, v) \in [0, 1] \times (-\infty, \infty)$:

For $(x, v) \in [0, 1] \times (-\infty, \infty)$:

Vlassov:
$$\partial_t f + v \partial_x f + q E \partial_v f = 0$$
 Poisson: $-\partial_x^2 \phi = \rho$ $(-\partial_x \phi = E)$

For $(x, v) \in [0, 1] \times (-\infty, \infty)$:

Vlassov:
$$\partial_t f + v \partial_x f + q E \partial_v f = 0$$
 Poisson: $-\partial_x^2 \phi = \rho$ $(-\partial_x \phi = E)$

$$f(0,\mathbf{v},t)=f(1,\mathbf{v},t) \hspace{0.5cm} \phi(0,t)=\phi(1,t) \hspace{0.5cm} \partial_{x}\phi(0,t)=\partial_{x}\phi(1,t)$$

For $(x, v) \in [0, 1] \times (-\infty, \infty)$:

Vlassov:
$$\partial_t f + v \partial_x f + q E \partial_v f = 0$$
 Poisson: $-\partial_x^2 \phi = \rho$ $(-\partial_x \phi = E)$

$$f(0,\mathbf{v},t)=f(1,\mathbf{v},t) \hspace{0.5cm} \phi(0,t)=\phi(1,t) \hspace{0.5cm} \partial_{x}\phi(0,t)=\partial_{x}\phi(1,t)$$

$$f(x,v,t) = f_0(x,v)$$
 $ho(x,t) = q \int_{-\infty}^{\infty} f(x,v,t) dv + 1$

Green's Function Solution for $\phi(x, t)$

We can solve the Poisson Eq. $(-\partial_x^2 \phi = \rho)$ with the periodic extension of the free-space **Green's Function** for the 1D Laplacian:

$$\phi(x,t)=\int_0^1\left(g(x,y)-xy
ight)
ho(y,t)dy,\quad g(x,y)=-rac{1}{2}|x-y|$$

Green's Function Solution for $\phi(x, t)$

We can solve the Poisson Eq. $(-\partial_x^2 \phi = \rho)$ with the periodic extension of the free-space **Green's Function** for the 1D Laplacian:

$$\phi(x,t)=\int_0^1\left(g(x,y)-xy
ight)
ho(y,t)dy,\quad g(x,y)=-rac{1}{2}|x-y|$$

From the potential ϕ we can also obtain the electric field *E*:

$$E(x,t) = \int_{-\infty}^{\infty} \int_{0}^{1} \underbrace{(g_{x}(x,y) + x - y)}_{\text{Kernel } K(x,y)} f(y,v,t) dy dv$$

• Represent the plasma by electrons by *N* charged particles in **phase space**.

▶ < ⊒ ▶

- Represent the plasma by electrons by *N* charged particles in **phase space**.
- $f(x, v, t) \rightarrow x_i(t), v_i(t),$ $i = 1 \dots N.$

• Represent the plasma by electrons by *N* charged particles in **phase space**.

•
$$f(x, v, t) \rightarrow x_i(t), v_i(t),$$

 $i = 1 \dots N.$

Particle Phase Space (N = 32, $\delta = 0.0$, $\Delta t = 0.01$, $\varepsilon = 0.05$)

ŀ

Plasma Discretization

• Represent the plasma by electrons by *N* charged particles in **phase space**.

•
$$f(x, v, t) \rightarrow x_i(t), v_i(t),$$

 $i = 1 \dots N.$

Particle Phase Space (N = 32, $\delta = 0.0$, $\Delta t = 0.01$, $\varepsilon = 0.05$)

$$egin{aligned} \mathcal{K}(x,y) &= g_x(x,y) + x - y \ &= -rac{1}{2} \mathrm{sgn} |x-y| + x - y \ \mathcal{K}(x,t) &= \int_{-\infty}^\infty \int_0^1 \mathcal{K}(x,y) f(y,v,t) dy dv \end{aligned}$$

• Represent the plasma by electrons by *N* charged particles in **phase space**.

•
$$f(x, v, t) \rightarrow x_i(t), v_i(t),$$

 $i = 1 \dots N.$

Particle Phase Space (N = 32, $\delta = 0.0$, $\Delta t = 0.01$, $\varepsilon = 0.05$)

$$\begin{split} \mathcal{K}(x,y) &= g_x(x,y) + x - y \\ &= -\frac{1}{2} \mathrm{sgn} |x - y| + x - y \\ \mathcal{E}(x,t) &= \int_{-\infty}^{\infty} \int_0^1 \mathcal{K}(x,y) f(y,v,t) dy dv \\ &\approx \sum_{j=1}^N \mathcal{K}(x,x_j) w_j \end{split}$$

With a discretized plasma, we can calculate the acceleration felt on each of the particles:

$$x_i''(t) = qE(x_i, t)$$

With a discretized plasma, we can calculate the acceleration felt on each of the particles:

$$x_i''(t) = q E(x_i, t) = -\sum_{j=1}^N K(x_i, x_j) w_j$$

With a discretized plasma, we can calculate the acceleration felt on each of the particles:

$$x_i''(t) = qE(x_i, t) = -\sum_{j=1}^N K(x_i, x_j)w_j = \sum_{j=1}^N \left(\frac{1}{2} \text{sgn}|x_i - x_j| - x_i + x_j\right)w_j$$

Center Irregularities

Due to lack of continuity in the kernel function K(x, y):

$$K(x,y) = -\frac{1}{2}$$
sgn $|x - y| + x - y$

(4) E > (4) E >

Center Irregularities

Due to lack of continuity in the kernel function K(x, y):

$$K(x,y) = -\frac{1}{2}$$
sgn $|x - y| + x - y$

Solution: Add a regularization parameter δ :

$$\mathcal{K}_{\delta}(x,y)=-rac{x-y}{2\sqrt{(x-y)^2+\delta^2}}+x-y$$

▶ < ⊒ ▶

Center Irregularities

Due to lack of continuity in the kernel function K(x, y):

$$\mathcal{K}(x,y) = -rac{1}{2} \mathrm{sgn} |x-y| + x - y$$

Solution: Add a regularization parameter δ :

$$\mathcal{K}_{\delta}(x,y)=-rac{x-y}{2\sqrt{(x-y)^2+\delta^2}}+x-y$$

Regularized vs. Non-regularized K(x, y) for y = 0.5
